INTRODUCTION

Research on organoselenium compounds has been driven by the potential applications of selenium compounds in modern organic synthesis and catalysis. Among these organoselenium compounds, aryl- and vinyl selenides are certainly the most applied compounds in organic synthesis. A large number of methodologies have been reported to prepare these compounds; however, the reaction often needs harsh reaction conditions or non-recyclable catalysts. In this context, the use of ionic liquids (IL) as recyclable solvent for mild preparation of diorganyl selenides was recently described. On the basis of economic criteria and possible toxicological concerns, it is desirable to minimize the amount of utilized liquid ion and catalyst in a potential process. Thus, the concept of supported ionic liquid catalysis (SILC) emerges as alternative for green synthesis of organoselenium compounds. Therefore, herein we disclose a new and efficient methodology to prepare diorganyl selenides employing the SILC system with In (III) lewis acid as anion (Scheme 1).

RESULTS AND DISCUSSION

The support and characterization of new [MPIM][InCl4] alkoxy silane derivative on Al2O3 was achieved as previously described. Our initial studies have focused on the development of an optimum set of reaction conditions. In this approach, diphenyl diselenide 1 and 4-methoxyphenyl boronic acid 2 were used as model substrates (Table 1).

CONCLUSION

In conclusion, we demonstrate a new and efficient methodology to prepare diorganyl selenides employing the SILC system. Studies towards the catalyst recyclability, mechanism and scope reaction are in progress.

* 0.3 mmol of 1 / 0.55 mmol of 2. All reactions were performed for 48 h. * GC yields.

The use of catalyst in an amount of 10 mol % on DMSO at 130°C gives the best results, furnish the compound 3 in good yield (Table 1, entry 1). It can be observed lower yields with reduction of reaction times and temperatures. When the catalyst loading was reduced (5 mol %), the yield decreases to 58% (entry 2). The desired product was not obtained only which Al2O3 or in absence of In (III) as anion (entries 3 and 4). These results suggest that the success of the reaction depends of Lewis acid in the supported ionic liquid. Finally, we observed that the solvent was important for the reaction success. When DMF, 1,4-dioxane, water or toluene were used, the desired product 3 was not obtained (entries 5-8).
